

An urban management framework based on the spatial analysis of global economies

A retrospective of urban form through Urban Morphometrics analysis

Carolina Rigoni

When economies transit from one type to the other, they also leave behind common problems in the urban form of the city, which impact the functioning of new urban systems.

The analysis of global economic cycles, the understanding of different assets of urban redevelopment, the contribution of urban form and spatial arrangement, and its impact on the evolution of the city will allow the development of a framework to understand which urban forms are more resilient and conducive to accommodating significant urban changes across society and the economy. The final framework will be the result of the analysis of a wide range of initiatives and urban redevelopments, the spatial profile of each major economic phase, and the identification of outstanding lessons and common patterns.
