

Culture and Space Transformation – A Decolonial Approach

Seabo B. Morobolo

One of the greatest changes in modern history has been from industrial to post-industrial society. As a result of deindustrialisation, policymakers had to find new ways to promote their cities to take part in the global competition. However, these attempts to attract new investors into city centres led to an uneven development within the cities. Due to these growing inequalities, post-industrial cities require a balanced policy formulation to tackle economic, social and environmental problems with the purpose of enhancing quality of life for all. This thesis aims to generate a quality of urban life model specific for post-industrial cities to be able to achieve a more balanced policy formulation.
